VibeShelf – Scope Statement

Project Description

VibeShelf is a mobile application designed to help readers choose their next book based on their current mood and to organize their personal book collections. The system addresses reading indecision by enabling users to apply mood-based filters and generate personalized book recommendations.

The application combines features similar to Goodreads (ratings and community reviews) and Libib (book inventory management), while uniquely focusing on mood-driven recommendations to simplify the decision-making process.

VibeShelf will allow users to:

- Create and manage a personal account
- Build and organize a digital bookshelf
- Add books manually (and potentially scan barcodes*)
- Track reading status and progress
- Select a current mood and apply filters to generate a book recommendation
- Re-generate recommendations if desired
- Rate and review books
- View community ratings and reviews
- Search for books by title or author

The primary objective of VibeShelf is to reduce indecision, increase reading engagement, and provide an organized system for managing personal book collections.

Exclusions

- In-app book purchasing
- E-book reading functionality
- Audiobook streaming
- Direct messaging between users
- Integration with public library systems
- Analytics dashboards
